

GENERAL SURGERY - OPERATIVE REPORT

Hospital: St. Jude Medical Center

Date of Operation: November 04, 2026

Surgeon: Dr. M. Aris

Patient: James Wilson (Age 45)

MRN: 88472910

Preoperative Diagnosis: Acute Appendicitis

Postoperative Diagnosis: Acute gangrenous appendicitis with localized micro-perforation.

Procedure Performed: Laparoscopic Appendectomy

Anesthesia: General Endotracheal

Estimated Blood Loss: < 20 mL

Specimens Sent: Appendix to Pathology

Operative Findings:

Upon laparoscopic entry, purulent fluid was noted in the right lower quadrant. The appendix was highly inflamed, gangrenous at the tip, and showed signs of a localized micro-perforation.

Procedure Details:

The appendix was isolated, and the mesoappendix was divided using electrocautery. The base of the appendix was secured with endo-loops and transected. The specimen was placed in an endocatch bag and retrieved. The right lower quadrant was copiously irrigated with warm saline until the effluent was clear. Hemostasis was achieved. Trocars were removed and incisions closed with surgical glue.

Postoperative Plan:

1. Admit to surgical ward for overnight observation.
2. IV antibiotics (Zosyn) for 24 hours due to localized perforation.
3. Advance to clear liquid diet as tolerated.
4. Pain management with IV Toradol and PRN Oxycodone.
5. Discharge anticipated tomorrow if patient is afebrile and tolerating a normal diet.
