

PEDIATRIC CLINIC PROGRESS NOTE

Date: November 05, 2026

Patient: Leo Miller

Age: 4 years old

Accompanying Parent: Mother (Sarah Miller)

Subjective:

Leo is here for his routine 4-year-old well-child exam. Mother reports he is doing very well. He attends preschool 3 days a week and enjoys it. No concerns with hearing or vision. Diet is varied, though mother notes he can be a "picky eater" with vegetables. Bowel movements are regular.

Only minor concern: Mother notes a small, dry, itchy patch of skin on the back of his left knee that flares up during colder weather.

Objective:

- Vitals: Wt: 36 lbs (50th percentile) | Ht: 40 inches (65th percentile) | HR: 95 bpm | Temp: 98.6 F
- General: Well-developed, playful, interactive 4-year-old.
- Skin: 2x2 cm patch of mild erythema and scaling in the left popliteal fossa. No weeping or signs of infection.
- Lungs/Heart: Clear to auscultation bilaterally. Regular rate and rhythm.
- Neuro: Normal gait, passing all 4-year-old developmental milestones (can hop on one foot, draws a circle, speaks in full sentences).

Assessment:

1. Healthy 4-year-old male, growing appropriately.
2. Mild atopic dermatitis (eczema).

Plan:

1. Administered routine 4-year immunizations (DTaP, IPV, MMR, Varicella) today in clinic. Handout provided to mother regarding potential mild side effects (low-grade fever, soreness).
2. For eczema: Recommend daily application of unscented emollient creams (e.g., Aquaphor or Cerave) immediately after bathing. Prescribed Hydrocortisone 2.5% ointment to use twice daily for up to 7 days during flare-ups only.
3. See back in 1 year for 5-year well-child check, or sooner if needed.
